SUMMARY

Software Engineering graduate with hands-on, self-taught experience in operating systems, virtualization, and PC hardware. Daily Linux user with working knowledge of Windows internals, VM setup and management, and end-to-end hardware troubleshooting. Seeking an IT systems and infrastructure role where deep OS familiarity and a hands-on problem-solving approach are put to practical use.

TECHNICAL SKILLS

Operating Systems: Linux (daily driver — installation, configuration, package management, shell, file system, permissions), Windows 10/11 (system files, registry, services, device drivers)

Virtualization: Virtual machine setup, deployment, and management; Docker and Docker Compose

Hardware: Desktop and laptop assembly, diagnostics, component replacement, BIOS/UEFI configuration, peripheral and device troubleshooting

Systems & Security: Antivirus and malware scanning, OS-level troubleshooting, system maintenance, backups, driver and firmware management, mobile device flashing and recovery

Networking: TCP/IP fundamentals, network device configuration and troubleshooting, computer communication networks (coursework)

Tools: Git, GitHub, command line utilities, PostgreSQL

Programming: Python, Java, JavaScript

SYSTEMS & INFRASTRUCTURE EXPERIENCE

Self-Directed — Ongoing since 2016

- Run Linux as a primary daily operating system: handle installation, driver and kernel issues, package management, permissions, and system recovery without stepping outside the OS.
- Set up and manage virtual machines for testing operating systems and isolating software, including guest configuration, resource allocation, and troubleshooting boot and driver failures.
- Diagnose and repair Windows systems at the file, registry, and service level — resolving driver conflicts, compatibility failures, and configuration problems that standard troubleshooting does not fix.
- Troubleshoot and repair PC hardware across desktops and laptops: component-level fault isolation, replacement, BIOS/UEFI configuration, thermal and power issues.
- Flash and recover Android devices — bootloaders, custom firmware, partition layouts, and restoring bricked hardware.
- Perform routine system maintenance for personal and family machines: malware scanning and removal, backups, updates, and performance tuning.

PROJECTS

GitHub Search Engine | *Docker, Docker Compose, FastAPI, PostgreSQL*

- Containerized a multi-service application with Docker Compose, producing a reproducible deployment that runs identically across environments.
- Configured service networking, environment variables, and persistent volumes for a PostgreSQL database container.
- Built a document crawling and indexing pipeline with a PostgreSQL schema optimized for fast query lookups.

Net Zero — Expense Tracker App | *React Native, Expo, JavaScript* — netzzero.aqifahmed.com

- Built and shipped a cross-platform mobile app with full offline capability and persistent local storage.
- Designed the app around a central state layer and reusable components with input validation.

EDUCATION

Bachelor of Science in Software Engineering

University of Central Punjab (UCP), Lahore

Relevant Coursework: Operating Systems | Computer Communication Networks | Data Structures & Algorithms | Software Construction & Design | Object-Oriented Programming | Advanced Web Programming | Applied Machine Learning | Formal Methods in Software Engineering

ADDITIONAL

Languages: English (professional working proficiency), Urdu (native)

Location: Based in Lahore; able to work on-site full time.
